

Securing the future of education with Blockchain

Kim Flintoff
Learning Futures

Perth Blockchain Conference
May 18, 2018

ABSTRACT

As all levels and sectors of education contemplate ongoing developments in digital technology, distributed and fragmented models of learning, stackable credentials, and educational unbundling the potential for a system like blockchain to bring security to a diverse landscape of evidence of learning, recognition of learning and acknowledgement of learning becomes more relevant.

As MOOCs, SPOCs, online courses, RPL and alternative credentialling become more ubiquitous the main stakeholders in education, industry and government are realising the need for systems that enable higher levels of trust when certificates, awards and prior learning recognition are at stake.

This session will discuss some of the needs and some of the attempts already in place globally.

What we learned from designing an academic certificates system on the blockchain

“The blockchain is not a simple solution that will fix everything that is wrong with today’s credentials. But it does offer some possibilities for improving the system we have today—and that’s what we are excited to explore.”

“We wanted to reserve the possibility to revoke a certificate.”

Blockchain is fast becoming more than just a buzzword. As organizations continue to educate themselves on the technology and its capabilities, the number of potential use cases where blockchain can play a real and disruptive role is rising. With bitcoin cryptocurrency as the first use case, the main focus has been on the financial services industry; particularly around payment, capital markets, lending, and regulatory reporting. However, there has been a recent shift to looking beyond these use cases and identifying other areas or processes across industries where blockchain would have an impact. One such area is education qualifications.

Deloitte's EMEA Blockchain Center of Excellence based in Dublin has developed a blockchain solution around the collection, validation, secure storage, and sharing of education qualifications. This increases the efficiency of the onboarding process of new employees along with tracking the continuous development of employees across the organization. This platform was originally designed to address a regulatory requirement within the financial sector, and can be leveraged across industries, sectors, and geographies to manage qualification requirements of all potential and existing employees. ➤

Key Advantages of Blockchain Technology

- Self-sovereignty,
- Trust,
- Transparency & Provenance,
- Immutability,
- Disintermediation,
- Collaboration.

Further applications in:

- verification
- data management structures
- payment for tuition and services

Transformation of Education?

1. Disrupting the Current Education Model
2. Storing Permanent Records
3. Identity Verification & Information Security
4. Student Ownership of Learning
5. Interactive Learning & Analytics
6. Automatic Transfer of Credits
7. The “Lifelong Learning Passport”
8. Copyright for Educational Content
9. Multi-Step Accreditation
10. Payment and Funding

10 ways Blockchain could be used in education

September 12, 2016 Opinions

By Donald Clark

What is blockchain? Can it be used in education? In 2001, I designed and implemented a Napster-like system with no central storage or control that distributes learning content across a network for non-competing public-sector bodies. Everyone who created content could share it.

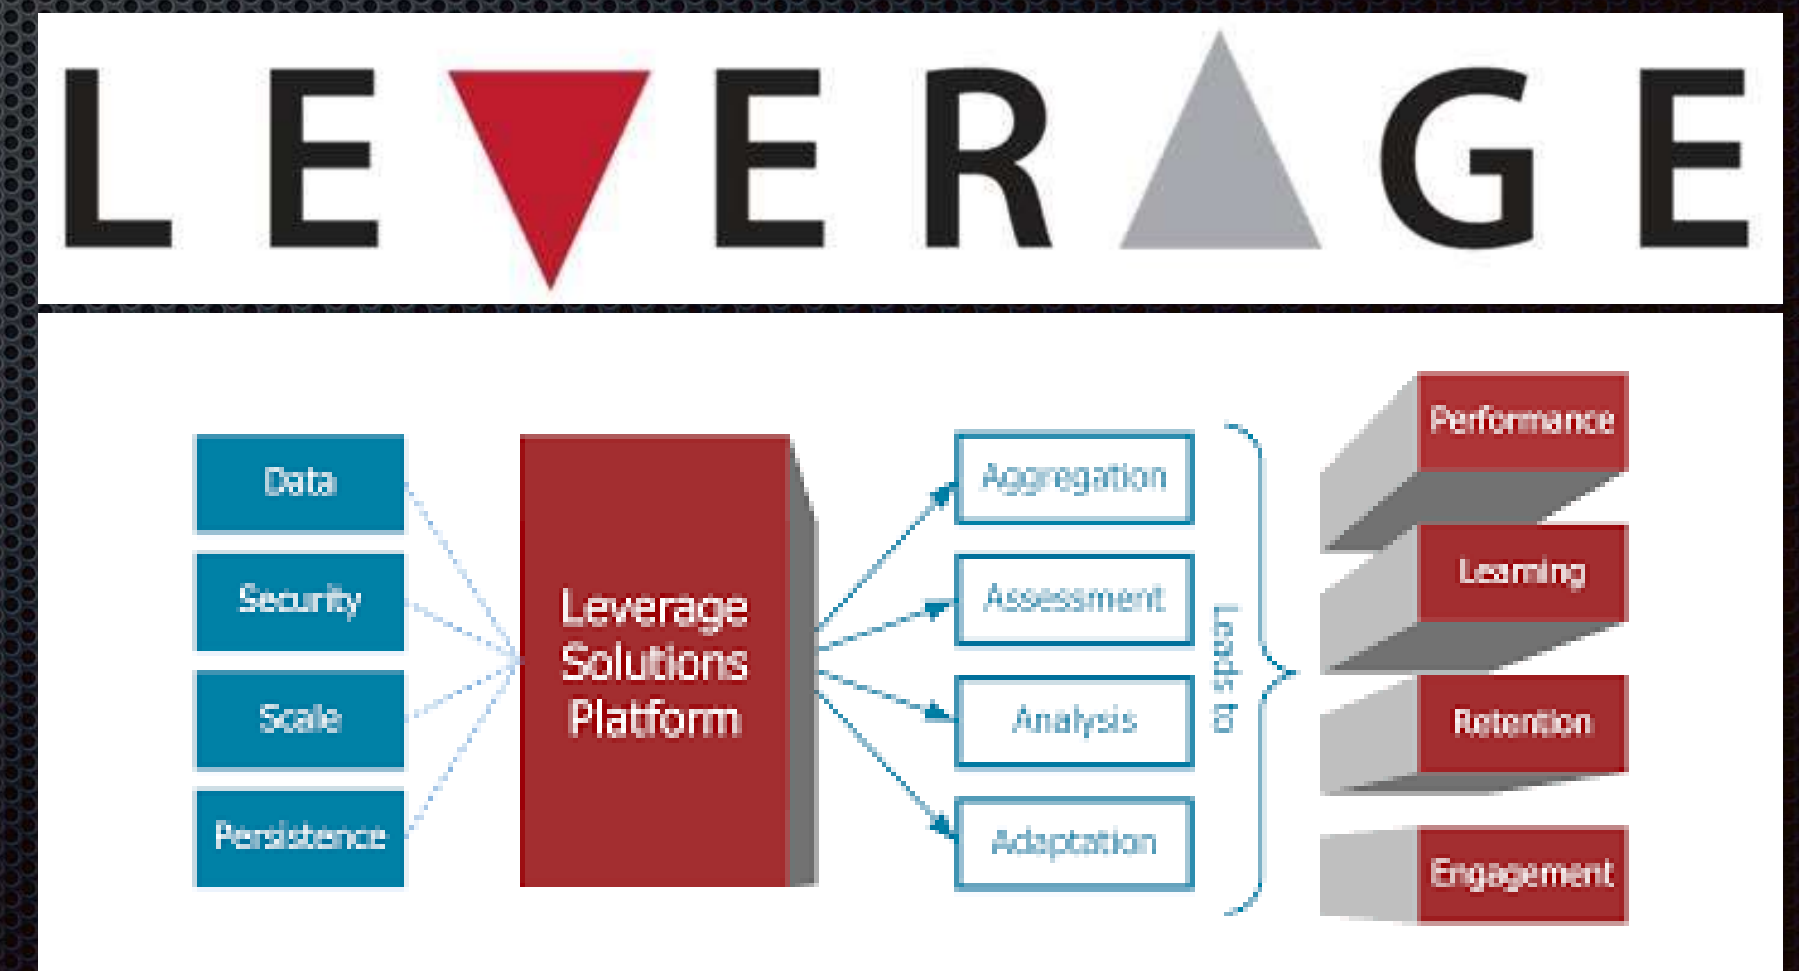

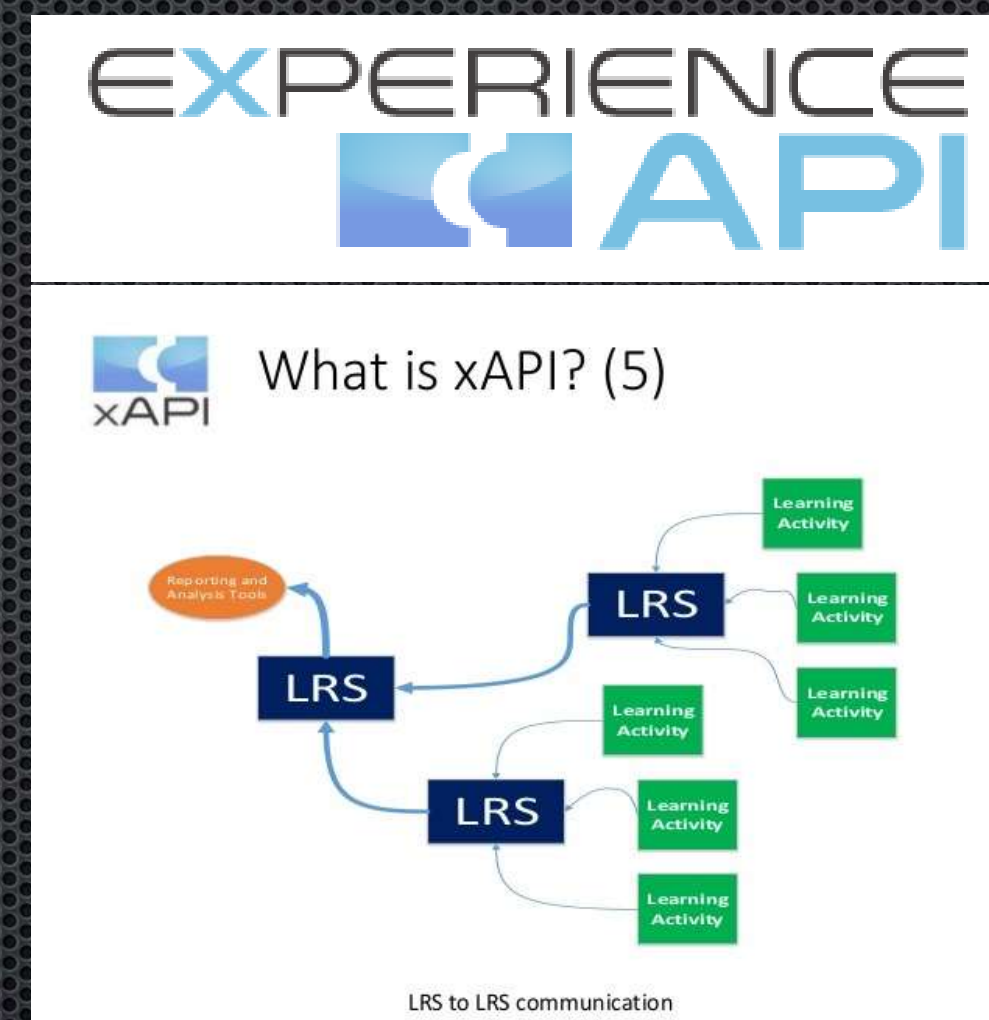

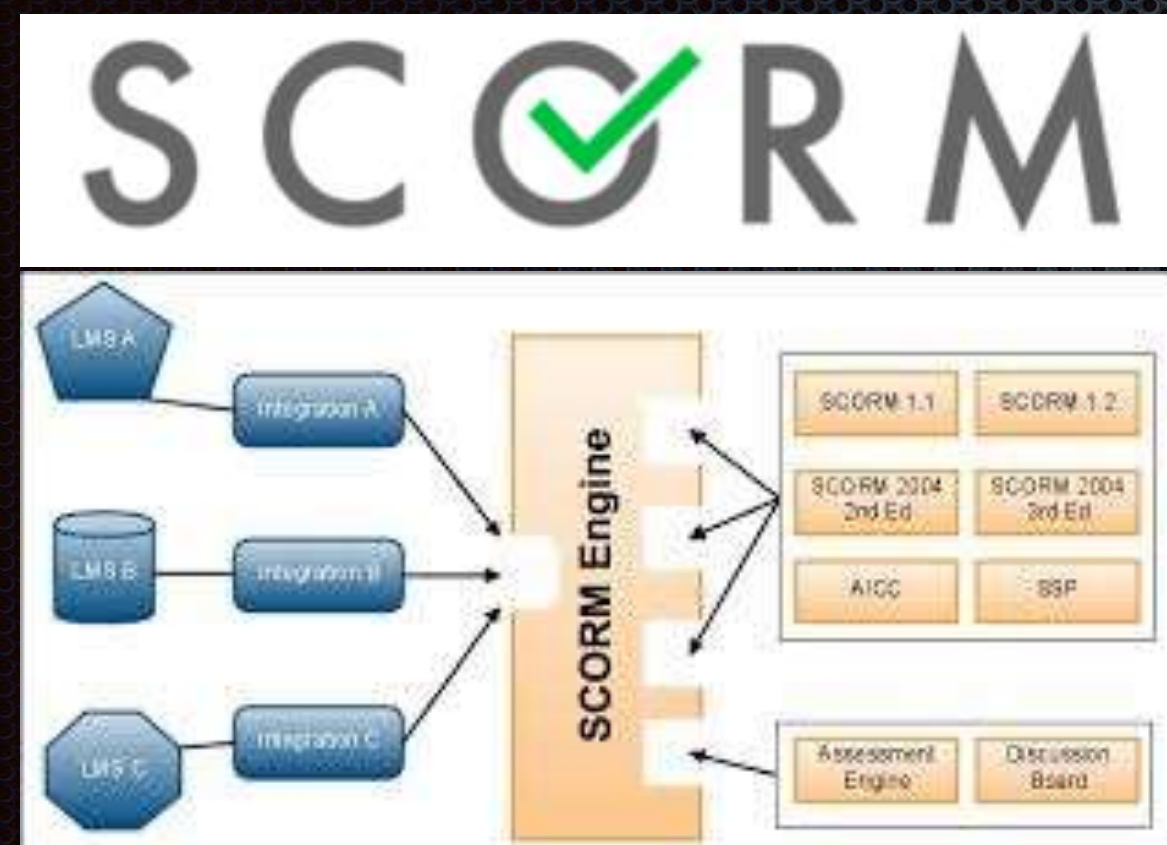

It didn't work because, despite being non-competitors, the public sector organisations just didn't like innovation and stuck to their institutional silos. They were fixed in their old ways – with massive duplication of content and no sharing, which is as true today as it was then. The same fate, I fear, could happen to Blockchain technology – but let's

explore its potential.

1. Single institution
2. Groups of institutions
3. National database
4. Global Assessment
5. Open Badges
6. MOOCs
7. Corporate Learning
8. Continuing Professional Development
9. Apprenticeships
10. Knowledge management

Learning Analytics

Gathering evidence from micro learning experiences

Potential impacts

EU proposes:

“creating and promoting a label for ‘open’ educational records, which enshrines the principles of recipient ownership, vendor independence and decentralised verification – and only supports or adopts technologies in compliance with such a label.”

Wicked Questions

- Is learning transactional?
- What constitutes trust in education?
- Can current education systems manage the complexity of blockchain strategies?
- What's the purpose of mining in an educational blockchain?
- What effects upon privacy (What is a real “permanent record”)?
- Does any of this actually solve any educational problems?
- What problems might be introduced by blockchain strategies?
